INTRODUCTION

The U.S. Fish and Wildlife Service (FWS) is the principal Federal agency that provides information to the public on the extent and status of the Nation's wetlands. The mapping was accomplished using ArcMap in a heads-up mapping process, using freely available public datasets. The wetlands mapping was based on interpretations of 2013 color-infrared leaf-on aerial imagery from the National Agriculture Imagery Program (NAIP). Ancillary datasets included hydric soils (SSURGO), U.S. Geological Survey (USGS) topographic maps, digital elevation data, additional leaf-off orthophotography, and the previously derived NWI wetlands dataset. During the initial mapping, site visits were conducted for field verification of photointerpretations.

Following the mapping, polygon errors were corrected using custom QAQC tools, and the data was checked using internal QC reviews. The mapping followed national standards, including the Federal Geographic Data Committee (FGDC) Wetlands Classification Standard, the FGDC Wetlands Mapping Standard, and the FWS Data Collection Requirements and Procedures. Wetland classifications were based on the FGDC Wetland Classification Standard (FGDC 2013).

STUDY AREA

The three Madison area watersheds that comprise the study area are located in south-central Wisconsin and include the Headwaters Yahara River (HUC 0709000205), Lake Mendota – Yahara River (HUC 0709000206), and Lake Monona – Yahara River (HUC 0709000207) (Figure 4). Together, these watersheds total 208,010 acres and comprise the northernmost portion of the Middle Rock hydrologic subbasin.

General description

The project area encompasses three watersheds comprising the greater Madison, WI area. Most of the area is in Dane County, with the upper portion of the Yahara River Headwaters overlapping Columbia County. In addition to the city of Madison, the region includes the surrounding communities and suburbs of Waunakee, DeForest, McFarland, Fitchburg, and Middleton. The area includes three of the four major lakes in the Madison chain of lakes: Lake Mendota, Lake Monona, and Lake Waubesa, in addition to the smaller Upper Mud Lake and

Lake Wingra. The Yahara River is the main tributary to this chain; other significant tributaries include Sixmile Creek, Token Creek, Starkweather Creek, Dorn Creek, Wingra Creek, Nine Springs Creek, and Swan Creek.

Geography

Madison is located in the southern prairie section of Wisconsin, overlapping Dane and Columbia Counties. The physical geography is relatively flat, with a few hills, owing to its glacial history.

Vegetation, soils, land use

The southern portion of the watersheds comprising the city of Madison and its suburbs is predominantly urban, suburban, and developed. As the northern portion gradually stretches away from Madison, it transitions to more rural agriculture with smaller exurban communities.

Cherokee Marsh is a major wetlands complex in the southern tip of the Yahara Headwaters watershed, where it adjoins Lake Mendota and the Yahara River/Lake Mendota Watershed. Nine Springs and Waubesa Wetlands Natural Areas are two other complexes located on the western side of Lake Waubesa in the Lake Monona – Yahara River watershed. Soils throughout the study area are predominantly silt loam over sandy loam originating from glacial till.

Natural history or important cultural features

Surrounding non-urban areas have a long history of agriculture which has changed the hydrology and vegetation of these areas. Original wetlands have been altered via drainage tiles in agricultural areas, or through urban development. Much of the city of Madison developed over previously existing wetlands. In addition, much of the original vegetation associated with prairies, oak forests, and savannas has been lost. In the overall Southeast Glacial Plains Ecological Landscape, only around 10% of the land area is forested.

Climate

The Madison area's average annual high and low temperatures are 56 °F and 37 °F, respectively, with an average annual precipitation of 34 inches, weighted towards the summer months.

CLASSIFICATION RESULTS

Overall, 14,156 acres of wetland and 17,395 acres deepwater habitat were classified in the Madison watersheds, representing 15% of the total 208,010 acre study area (Table 1). Figure 1-3 show distributions of surface water and wetland area for individual watersheds.

National Wetlands Inventory Map Report for the Madison Area Watersheds, Wisconsin

Project ID: R09Y16P01

Project Title or Area:

Madison Area Watersheds:

- Headwaters Yahara River (HUC 0709000205)
- Lake Monona – Yahara River (HUC 0709000207)
- Lake Mendota – Yahara River (HUC 0709000206)

Source Imagery:

- National Agriculture Imagery Program (NAIP) – 2013, Wisconsin, one-meter resolution, color infrared (CIR), leaf-on

Collateral Data:

- US Fish & Wildlife Service - National Wetlands Inventory, 2008 (Dane Co.) and 1999 (Columbia Co.)
- NRCS – Soil Survey for Columbia and Dane Counties (SSURGO)
- USGS – NHD National Hydrography Dataset
- USGS – EROS Orthoimagery, sub-meter resolution, true-color, leaf-off
- USGS – 1:24K topographic quadrangles

Inventory Method:

This original mapping project was accomplished using ArcMap10.x software in a heads-up mapping process, using freely available public datasets. The wetlands mapping was based on interpretations of 2013 color-infrared leaf-on aerial imagery from the National Agriculture

Imagery Program (NAIP). During the initial mapping in spring of 2015, site visits were conducted to ground-truth wetland photo interpretations.

Following the digitizing, polygon errors were corrected using custom QAQC tools, and the data was checked using internal QC reviews. The mapping followed national standards, including the FGDC Wetlands Classification Standard, the FGDC Wetlands Mapping Standard, and the FWS Data Collection Requirements and Procedures. Wetland classifications were based on the FGDC Wetland Classification Standard (FGDC 2013).

Classification:

The wetland classifications for the Madison watersheds project area are in accordance with the Classification of Wetlands and Deepwater Habitats of the United States (FGDC 2013), based on the original document of the same name by Cowardin et al. (1979).

Data Limitations:

Because this map was created through the interpretation of aerial photography, the user is cautioned of certain limitations and potential inaccuracies in dataset:

- In general, changes in the landscape after the date of imagery will result in discrepancies from current conditions.
- A small percentage of wetland areas may have gone unidentified, especially in forested areas where identification is difficult under vegetative cover.
- Aerial photography was captured during spring of 2013 for leaf-on season, which may have obscured wetlands in certain areas. Additional leaf-off orthoimagery was used to aid this discrepancy.
- The target mapping unit for this project was 0.5 acre, meaning that some but not all wetlands smaller than 0.5 acres were identified.
- Water regimes should be considered approximate, as they are difficult to ascertain from aerial photography, and limited field verification was possible.

Description of wetland habitats

Besides the predominant class of lacustrine deepwater habitat, palustrine emergent wetlands were the most common wetland type in each of the three watersheds, followed by palustrine forested/shrub wetlands. Table 2 contains descriptions for all wetland types identified in the Madison watersheds study area. Table 3 contains descriptions of special modifier codes.

Table 2. Description of attribute values.

Wetland Types	Description
L1UBH	Permanently flooded, deepwater habitat greater than 20 acres in size.
L2ABH	Permanently flooded, littoral deepwater habitat greater than 20 acres in size with aquatic beds.
L2EM2H	Permanently flooded, littoral deepwater habitat greater than 20 acres in size with emergent aquatic vegetation (e.g. white water lily).
L2UBH	Permanently flooded, littoral deepwater habitat greater than 20 acres in size.
PABG	Intermittently exposed ponds vegetated with aquatic beds (e.g., pondweed).
PABH	Permanently flooded ponds vegetated with aquatic beds (e.g., pondweed).
PEM1/SS1A	Temporarily flooded depressions and floodplains characterized by a matrix of herbaceous and deciduous scrub-shrub vegetation.
PEM1/SS1C	Seasonally flooded depressions and floodplains characterized by a matrix of herbaceous and deciduous scrub-shrub vegetation.
PEM1A	Temporarily flooded wetlands dominated by deciduous herbaceous vegetation.
PEM1C	Seasonally flooded wetlands dominated by deciduous herbaceous vegetation.

Wetland Types	Description
PEM1E	Wetlands dominated by herbaceous vegetation where the surface is inundated for extended periods during the growing season, or when not inundated the water table is usually at or near the surface throughout the growing season.
PEM1F	Semi-permanently flooded depressions dominated by herbaceous vegetation.
Pf	Palustrine agricultural wetlands.
PFO1/EM1A	Temporarily flooded depressions and floodplains characterized by a matrix of herbaceous and forested vegetation.
PFO1/EM1C	Seasonally flooded depressions and floodplains characterized by a matrix of herbaceous and forested vegetation.
PFO1/SS1A	Temporarily flooded depressions and floodplains characterized by a matrix of scrub-shrub and forested vegetation.
PFO1/SS1C	Seasonally flooded depressions and floodplains characterized by a matrix of scrub-shrub and forested vegetation.
PFO1A	Temporarily flooded depressions and floodplains dominated by deciduous forested vegetation.
PFO1C	Seasonally flooded depressions and floodplains dominated by deciduous forested vegetation.
PFO1F	Semipermanently flooded depressions and floodplains dominated by deciduous forested vegetation.
PSS1/EM1A	Temporarily flooded depressions and floodplains characterized by a matrix of scrub-shrub and forested vegetation.
PSS1A	Temporarily flooded scrub-shrub wetland usually located in drainages.

Wetland Types	Description
PSS1C	Seasonally flooded scrub-shrub wetland usually located in drainages.
PSS1F	Semipermanently flooded scrub-shrub wetland usually located in drainages.
PUBF	Semi-permanently flooded ponds.
PUBG	Intermittently exposed flooded ponds.
PUBH	Permanently exposed flooded ponds.
R2UBF	Semipermanently flowing lower perennial rivers.
R2UBG	Intermittently exposed lower perennial rivers.
R2UBH	Permanently flowing lower perennial rivers.

Table 3. Description of special modifiers.

Special Modifier	Description
x	Excavated - Lies within a basin or channel excavated by humans.
d	Partially Drained/Ditched – The water level has been artificially lowered through the use of human-made ditches and drains, but the area is still classified as wetland because soil moisture is sufficient to support hydrophytes.
f	Farmed wetlands occur where the soil surface has been mechanically or physically altered for production of crops, but where hydrophytes would become reestablished if the farming were discontinued. Farmed wetlands should be classified as Palustrine-Farmed.
h	Diked/Impounded - Created or modified by a human-made barrier or dam which obstructs the inflow or outflow of water.
r	Artificial - Substrates classified as Rock Bottom, Unconsolidated Bottom, Rocky Shore and Unconsolidated Shore that were emplaced by man using natural or synthetic materials.
